

A

Apramycin against *M. tuberculosis*, 32-fold concentration range

**B**

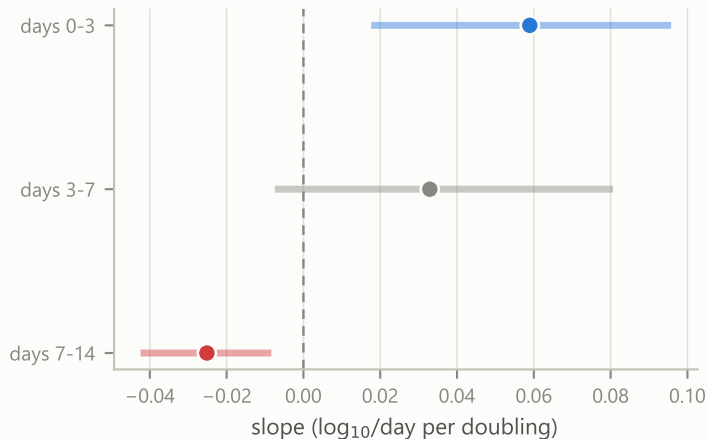

Read late, the dose range disappears

The same 32-fold range of concentration, summarised at each sampling day. A 14-day readout would call this drug dose-insensitive.

C

Positive early, reversed late

Bootstrap over all three replicates at both ends of every interval, 20,000 draws. The late sign is not claimed: the top arm may be censored (panel A).
