

**A****A rate is estimable in all six**

MXF 10x MIC. Bars are 95% profile-likelihood intervals from the censored (Tobit) fit. Blue: laboratory with a flask ever below the floor at the 100  $\mu$ L plating; orange: never, in any arm.

**B****The inoculum splits them; the rate does not**

The three lowest starting densities are exactly the three laboratories that crossed at the 100  $\mu$ L plating. F kills faster than four of the other five and never crosses.
