

Kaplan-Meier, all treated flasks, 100 uL plating. Three curves never descend: those laboratories recorded no flask below the limit in any arm, so no clearance time exists.

The three lowest starting densities are exactly the three laboratories that cleared at the 100 uL plating. F kills faster than four of the other five and never clears.

Grey: laboratory alone. Arrow head: after adding starting density. Blue crosses from significant to not. Orange (C) stays significant and also has the fastest rate.
