

The persistence level of Boccarella et al. (2026), estimated from their own survival data

Survival data reused under CC BY 4.0 from doi:10.6084/m9.figshare.31389142. Model re-implemented from the authors' deposited code.

C: across the plotted range of d_P the log-likelihood changes by less than 10^{-13} , because survival depends on α and d_P only through their product.

The data therefore determines a curve in this plane, not a point, and α is not identifiable from survival data alone.
